

# SIP Trunking

Route your calls via smart and flexible IP trunk lines

A low-cost alternative to traditional ISDN/PSTN landlines for on-premise phone systems.

Compatible with all the leading IP PBX brands you can quickly connect your phone system to our IP network and start making high quality voice calls over the internet.

SIP delivers a high-end business grade solution that brings together your voice and data, staff can seamlessly communicate in the office, at home or around the world across the data network, with no change to call quality.

## Business Benefits of SIP Trunking

### Reduce costs

Save on call costs, rental charges, business continuity, calling and network features in comparison to traditional fixed line services.

### Quick to deploy

Add SIP trunks on a channel by channel basis to match your business need. Real-time provisioning means immediate service delivery.

### Flexible

With no need for additional phone line installation, SIP Trunks can be scaled up or down in line with your changing needs.

### Fully managed

We take care of everything - from making sure your broadband connection is up to speed to testing call quality. Our team is only ever a call away.

### Business continuity

SIP can provide automatic failover to another site, ideal when you have on-site problems like power-cuts or loss of service. It takes just a few minutes to re-route your calls to an alternative location.

### Stress-free migration

Switching is simple with number porting enabling staff to use the same geographic number.

## Is your business ready for the all-IP revolution?

As more businesses adopt all-IP working, Openreach plan to withdraw their ISDN and PSTN landline network in 2025. Migrating to an alternative IP voice service such as Hosted Voice or SIP Trunking is easier than you think. Simply order an internet connection from NTE or use an existing connection to benefit from IP technology.
